## **Abstract**

This brief report consists of 19 tables, which display the frequencies, means and standard deviations for the equalitarianism, racial prejudice, moral traditionalism, and government interventionism scales, as well as the inter-item correlations, the average of correlations and the reliabilities for each of these scales for each year in which they have appeared in an Election Study. For this report, we have selected only items and scales which are currently in use in NES data collections, as defined by their appearance in the 1992 Election Study.
