1. ANES 2016 Recruitment Pretest Study at a Glance

Title:	ANES 2016 Recruitment Pretest Study [dataset].
Purpose:	The ANES 2016 Recruitment Pretest Study was a test of experimental survey methods to prepare for the internet component of the ANES 2016 Time Series Study. The purpose of the study was to optimize methods to recruit a representative probability sample of adult U.S. citizens by mail to respond to a two-wave panel survey on the Internet, and to achieve a high response rate.
Mode:	Internet.
Design:	Address-based sample and mail recruitment, and Internet interviews, with experimental manipulation of incentives, invitations, and screening modes.
Population:	U.S. citizens age 18 or older.
Field period:	Data collection for the "pre-election" interview ran from February 1, 2016 to April 4, 2016 for the main sample. Data collection for the "post-election" interview ran from April 6, 2016 to May 27, 2016 for the main sample. For the 200 cases in the supplemental sample, data collection for the "pre-election" interview ran from March 7, 2016 to May 6, 2016, and data collection for the "post-election" interview ran from May 11, 2016 to July 1, 2016.
Interviews:	Pre-election: 714; Post-election: 596
Variables:	This dataset is available in 4 files: (1) File 1: 989 variables, includes information on each household sampled, screening data from the online and mail screeners, survey responses from the "pre-election" interview, and survey responses from the "post-election" interview. (2) File 2: 193 variables, includes information on the mailings sent to each household, the record of contact with respondents, and user login information. (3) File 3: 1321 variables, includes information on the item timing and non-response prompts from the online screener, the "pre-election" interview, and the "post-election" interview. (4) File 4: 1916 variables, includes information from a commercial vendor on voter registration and turnout.
Language:	English.
Response rate (estimated, AAPOR, RR1):	39% (see "Methodology and Findings of the ANES 2016 Recruitment Pretest Study" for response rates by experimental condition).
Re-interview rate:	83% on the "post-election" interview.
Weights:	"HHFACTOR" accounts for household selection probability for all households sampled. For respondents who completed the surveys, use the poststratified weight variable "Weight" for any substantive analyses.
Data:	Data are available free of charge from the ANES website, www.electionstudies.org.

2. DESCRIPTION OF THE ANES 2016 RECRUITMENT PRETEST STUDY

The ANES 2016 Recruitment Pretest Study was a test of experimental survey methods to prepare for the internet component of the ANES 2016 Time Series Study. The purpose of the study was to optimize methods to recruit a representative probability sample of adult U.S. citizens by mail to respond to a two-wave panel survey on the Internet, and to achieve a high response rate.

In addition to its test of recruitment methods, the study also, incidentally, administered an entire ANES Times Series-type questionnaire to a representative sample of potential voters during the 2016 presidential primary season.

Using address-based sampling, 1,820 residential addresses were selected from the USPS delivery sequence file. The list of sampled addresses was enhanced with publicly and commercially available data about the residents of the addresses, including the residents' names. Addresses for which commercially available data indicated a resident's name and appeared reliable were considered "matched" and could be used to send named invitations to the study.

Addresses were assigned to one of five experimental conditions to test three alternative designs: invitations to named persons or "to the family" living at the sampled address; invitations involving a high up-front incentive or a lower up-front incentive followed by an offer of an increased incentive ("front-loaded" vs. "escalating"); and screening online or by mail.

The five experimental conditions were:

1) Condition 1A: Named invitations, front-loaded incentives
2) Condition 1B: Family invitations, front-loaded incentives
3) Condition 2A: Named invitations, escalating incentives
4) Condition 2B: Family invitations, escalating incentives
5) Condition 3: Mail screener

To correct an error in the within-household selection occurring in Condition 1B during fielding, a replacement sample of 200 addresses was worked. The total sample of addresses was 2,020.

For a detailed report on the methodology of this study, please see the "Methodology and Findings of the ANES 2016 Recruitment Pretest Study" available on http://www.electionstudies.org.

Description of Data

Because this study was designed to optimize methods to recruit a representative probability sample, this data release includes information on all facets of the study design. In addition to respondents' survey data for the screener, pre-election interview and post-election interview, this release includes information on the households sampled, the type of mailings each household received, respondents' contact with the survey team, respondents' survey login information, and commercial vendor data on respondents' registration status and voter turnout. When conducting substantive analyses on the respondents who completed the Pre or Post questionnaires, the poststratified variable `Weight` should be used. When conducting methodological analyses on a larger portion of the sample, including respondents who did not start or did not complete the questionnaires, the variable `HHFACTOR` should be used.

Note that the "pre-election" and "post-election" interviews are named only for their correspondence to the content of the pre- and post-election waves of the ANES Times Series study; an election did not occur between these two pretest interviews.

The data are included in 4 files:

1. **File 1**: 989 variables, includes information on each household sampled, the weight variables, screening data from the online and mail screeners, survey responses from the "pre-election" interview, and survey responses from the "post-election" interview.
2. **File 2**: 193 variables, includes information on the mailings sent to each household, the record of contact with respondents, and user login information.
3. **File 3**: 1321 variables, includes information on the item timing and non-response prompts from the online screener, the "pre-election" interview, and the "post-election" interview.
4. **File 4**: 1916 variables, includes information from a commercial vendor on voter registration and turnout.

Users can join these files on the variable `HouseholdID`.

Description of file: File 1

First, this file contains overview information on the households sampled. This includes the experimental condition to which each household was assigned (`ExperimentalCondition`), whether or not a screener was completed (`ScreenerStatus`), and the case dispositions for the pre-election interview (`PreElectionCaseDisp`) and post-election interview (`PostElectionCaseDisp`). Please see the Methodology report for more detailed information regarding the dispositions.

To conduct analyses on the respondents who completed the Pre questionnaire, please select `PreElectionCaseDisp`=10 ("10. PreElection Completed"). To conduct analyses on the respondents who completed the Post questionnaire, please select `PostElectionCaseDisp`=10 ("10. Post Complete"). Please note one case (`HouseholdID`=10001343) that was originally coded as a complete Pre interview but was later determined to be ineligible. This respondent's data are still included in the dataset but can be properly excluded from any analyses using the `PreElectionCaseDisp` variable, as the case is coded as Ineligible.

Note: Households in condition 3 that did not return the mail-back screener then followed the Hagan-Collier method, where they received a nonresponse followup mailing inviting a person described as the oldest or youngest male or female in the household to go online and take the survey. The variable `ScreenerType` denotes which of these methods was employed.

Next, this file contains all of the survey responses for the online screener and mail screener. The online screener data can be found in variables `DataCollection_Status1_Screener` to `DataCollection_FinishTime_Screener`. These variables have the designation "WEBSCRE" in their variable labels. The mail screener data can be found in the variables `Q1` to `Sampled`. These variables have the designation "MAILSCRE" in their variable labels. Due to the differences in format, the survey items for the online and mail screener differ slightly and are therefore kept as separate variables.

Finally, this file contains all of the survey responses for the pre-election and post-election interviews. The pre-election data can be found in variables `DataCollection_Status1_PRE` to `DataCollection_FinishTime_PRE`. These variables have the designation "PRE" in their variable labels. The post-election data can be found in variables `DataCollection_Status1_POST` to `DataCollection_FinishTime_POST`. These variables have the designation "POST" in their variable labels. The pre-election and post-election interview questions were based largely on the ANES 2012 Times Series interviews. The 2012 interviews were updated for 2016 (e.g., asking questions about the 2016 primaries and potential 2016 presidential choices) and edited to reduce programmer burden (e.g., fewer skip patterns, reduction in pre-loaded information). Some additional new items were also tested for potential inclusion in the 2016 Time Series.

Description of file: File 2

First, this file contains information on the mailings sent to each household (variables `CondInfo` to `AddressStatus_Mailing.20`). For more information on interpreting the meaning of mailing codes (`TaskCode.1` to `TaskCode.20`), please see the Methodology report (Appendix 3) for the flowchart of mailings for each condition. For example, in the variable `TaskCode.1`, there are values such as "01-ADV-MAIL," "05-ADV-MAIL," and "15-ADV-MAIL-INVITE1." From the Condition 1A and Condition 2A flowcharts, mailing #1 refers to "Mail Advance letter to preselect R." From the Condition 1B and Condition 2B flowcharts, mailing #5 refers to "Mail Advance letter to HH." From the Condition 3 flowchart, mailing #15 refers to "Mail invitation letter with paper screener."

Next, this file contains information on the contact respondents had with the survey team (variables `ContactDate.1` to `EROCDetail_redacted.15`), such as when respondents called or emailed about technical issues or payment questions. Information on the date, time, and type of contact was recorded for each instance of contact. A summary of the contact (with identifying information redacted) is included in the variable `EROCDetail_Redacted`.

Finally, this file contains login information for each login that the respondent made with his/her ID number (variables `UserAgent.1` to `LoginDT.16`). This information includes the user agent used for each login (i.e., the web browser and operating system), and the date/time of the login.

Description of file: File 3

This file contains the item timing data and item non-response prompt data for the online screener, pre-election interview, and post-election interview. The timing and non-response data for the online screener can be found in variables `SCREENER_S1_Time` to `SCREENER_ConsistencyCheck_NonRes`. The timing and non-response data for the pre-election interview can be found in variables `ABORTPRE_ABSELFSTD_Time` to `S_Roster_4__NonResp`. The timing and non-response data for the post-election interview can be found in variables `ABORTPO_ABDEF_Time` to `TIPI_PAGE_TIPIWARM_TIPIWARM_NonR`.

Description of file: File 4

This file contains information from a commercial vendor, Catalist, in the variables `PersonID.1` to `E2012GVM.239`. The vendor data is based on voter registration or voter turnout records for individuals, which are maintained in all 50 states and the District of Columbia (North Dakota does not have statewide voter registration but does maintain turnout records, which are regularly collected by the vendor). The vendor merges the voting data with other marketing-related information about individuals, such as demographic characteristics and purchasing habits, in order to sell or license the data for use in political canvassing, polling, fundraising, and other related activities.

Data for selected addresses were merged with data from the commercial list. Data from the vendor providing the commercial list included names and demographic information about the residents at the selected addresses, as well as voter registration status and voter turnout histories. All 1,820 sampled addresses were sent to the list vendor for matching. The vendor provided all persons listed in the vendor's national database at those addresses. If a target address provided to the vendor contained an apartment number, then the person records at that physical address with that apartment number, as well as all persons at that address with no apartment number, were included. As a result, there are up to 239 person records associated with any given ANES sampled address.

Addresses from Illinois (numbering 82) were excluded from matching because Stanford University, as a private institution, is not legally allowed access to voter records from that state. Of the remaining 1,738 addresses, 1,718 were matched by the vendor, and the vendor returned data on 5,380 individuals associated with these addresses. The same procedure was followed for the 200 supplemental cases. For more information on the matching process, see the Methodology report.

This file has 3 main pieces of information from the vendor: the political party of each person associated with the address (`LONGPARTYNAME_x.1` to `LONGPARTYNAME_x.239`), the registration status of each person associated with the address (`VOTERSTATUS.1` to `VOTERSTATUS.239`), and voter turnout in the 2012 general election (`E2012GVM.1` to `E2012GVM.239`).

One of the main goals of collecting this vendor data was to match the USPS Computerized Delivery Sequence File (DSF) data to the vendor data in order to find the name of at least one person we could be very confident was living at the sampled address. We wanted such a name so that we could address a letter to that person in order to screen the household and randomly select an eligible household member to participate in the survey (for conditions 1A and 2A). This matching process is detailed in the Methodology report. In File 4, there are 3 variables that provide information on the matching process. The first variable of interest is `DROPPED`, which flags records that were excluded for various reasons, such as individuals identified by the vendor as probably deceased.

The variable `DROPDS` gives more detail as to why an individual was excluded. The variable labels refer to the matching rules outlined in the Methodology report in Appendix 1. For example, the code "stage 1, likely deceased or deadwood" refers to the rules in Stage 1 in Appendix 1 which describe dropping records based on the vendor deceased/deadwood flags. Table 1 provides additional information for the values of `DROPDS`.

Table 1. Description of `DROPDS` values – reason individual was excluded from named-invitation selection

`DROPDS` value	Description of value
"stage 1, likely deceased or deadwood"	First, records were examined for the likelihood of being deceased or deadwood. The vendor included a "deceased" flag and "deadwood" model data. If the individual was flagged as being deceased or deadwood ("dead" or "probably dead"), the dropped record received the value "stage 1, likely deceased or deadwood."
"stage 1, address does not match"	Next, records were excluded if the address did not match, such as if the mailing address differed from the registration address or if the sampled address included an apartment number and the listed individual did not have an apartment number or had a different apartment number. Records dropped at this step were assigned the value "stage 1, address does not match."
"stage 1, duplicate"	Records were checked for duplicates, based on names and birthdates (see Stages 1h, 1i, 1j, and 1l for examples). When determining which record would be retained, preference was given to the record with `VOTERSTATUS`=active. The records dropped at this step were assigned the value "stage 1, duplicate."
"stage 1, likely not current resident"	For households with >2 records and >1 last names, it was considered possible that the records came from two successive households, i.e., records from the previous residents as well as current residents (NOTE: Households with >1 last name where it seemed likely that the wife did not take the husband's last name were restored in stage 2 and are not included in this category). For these "unusual blended households," records were excluded if it seemed likely that the person no longer lived at the address, such as if the deadwood model="Possibly dead" or `VOTERSTATUS`=dropped. Records dropped at this step were assigned the value "stage 1, likely not current resident"
"stage 2, dropped"	If a person was excluded due to the process in stages 2a-stage 2j, the dropped record was coded with "stage 2, dropped."
"stage 2, restored"	If a record was restored during stage 2, it was coded with "stage 2, restored."

After the `DROPPED` records were excluded, one person was randomly selected to be the "preselected" respondent (`PRESELECTED_R`) from the eligible names in the household, such that the survey mailings were addressed to this person. Preselected names were only needed for conditions 1A and 2A. After applying the matching rules, some addresses assigned to condition 1A or 2A – those experimental conditions designated for named invitations where good matches were obtained – were considered "unmatched" and were subsequently treated, for operational purposes, like the addresses in conditions 1B or 2B. This meant sending invitations addressed "to the family living at" instead of to named individuals.

Overall, sources of error in these vendor data include data entry and transcription errors when individuals complete voter registration forms and government agencies enter data from registration forms into their databases, data entry errors when elections officials record voter turnout, address matching errors, and other data processing errors. Combinations of such errors may be common in these data, and one of the purposes of collecting the data was to evaluate its research value.

It is important to note that this release relies on a national voter file vendor; this dataset was constructed to be as flexible for ANES users as possible while faithfully rendering the original voter file data. The collection and distribution of these voting data are an exploratory project to help determine the accuracy, validity, and value of the data and of ANES respondents' self-reported turnout history and registration status. Therefore, users may encounter some inconsistencies or confusing labels from the original vendor data. Please contact ANES staff if any questions arise, but note that we have little information beyond what is included here.

Weights and data analysis
There are two weight variables included in this dataset. The first weight variable `Weight` represents the poststratified weights that should be used when conducting substantive analyses. These weights are available for respondents who completed the Pre questionnaire. Please see the Methodology report for more information on the construction of the variable `Weight`.

The second weight variable `HHFACTOR` accounts for household selection probability only and is intended for methodological analysis of the data, such as computing response rates. `HHFACTOR` does not account for person selection probability within the household, nor has it been poststratified to improve the sample's representation of the demographic characteristics of the population. As a result, weighting by `HHFACTOR` alone does not fully account for respondent selection probability nor does it necessarily optimize the sample's representation of the population. However, because it is available for every household in the sample, it can be used when conducting methodological analyses that include parts of the sample that did not start or complete the surveys.

Restricted-use data
As with other ANES studies, most variables from the ANES 2016 Recruitment Pretest Study are included in the public-use data file that is available to the public for free. Access to some variables is restricted to protect respondent privacy. Such data are coded - 3, "Restricted access" on the public-use file. Restricted data include geographic details about where the respondent lives, the unedited open-ended text responses (though some redacted versions are on the public-use file), detailed occupational data, as well as any responses which (in combination with other available data) are too detailed to ensure anonymity, such as day of birth. Most of these data may be obtained by requesting special access, subject to certain conditions.

In general, when a variable is "Restricted," all data for the variable are coded as -3, "Restricted access" in the dataset. One exception was made for the household roster data collected from the online screener, mail screener, and pre-election survey, where data for certain households was restricted but the majority of data was left public. To minimize the disclosure risk for uniquely large households, if the household had 4 or more adults, we restricted the age data for all of the adults in the screener except for the individual who was selected to complete the survey. In the online screener, to determine which person from the roster was selected to complete the pre-election survey, we used data from the variables `ELIGSELECTED`, which provides the position of the person selected via randomization before the

roster, and `SELECTEDRosterPos`, which provides the position of the person selected after the roster. The `SELECTEDRosterPos` may differ from `ELIGSELECTED` if the original person selected was deemed ineligible from the roster (e.g., not a U.S. Citizen). For households with 4 or more adults, we left the age data for the person selected to complete the pre-election survey and set all other age values to -3, "Restricted access." In the mail screener, we followed the same procedure but used the variable `SAMPLED` to determine which individual was selected to take the pre-election survey. For roster data collected at the end of the pre-election survey, we set all age data for households with 4 or more adults to -3, "Restricted access," given that age data for the person who completed the survey is already included in the pre-election survey data.

Errors and problems in administration
ANES staff will continue to review the data, compile a list of errors or anomalies, and fix or document any problems. If you notice anything wrong with the data, please let us know by sending email to anes@electionstudies.org. Errata will be posted to the ANES website and will be corrected in future releases of the data.

3. LIST OF VARIABLES: FILE 1

VARIABLE NAME	VARIABLE LABEL	VARIABLE STATUS
FILE 1		
Version	Version of ANES 2016 Recruitment Pretest release	Public
HouseholdID	Household ID	Public
Weight	Poststratification weight for Pre completers	Public
HHFACTOR	Household selection factor	Public
ANESHouseholdsFile	Household data indicator	Public
ExperimentalCondition	Experimental treatment condition randomly assigned to address at sampling (use this variable for statistical analyses)	Public
OperationalConditionLoad	Treatment condition loaded into M3 database after operational changes to condition assignment	Public
OperationalConditionField	Treatment condition used in the field during data collection after operational changes to condition assignment	Public
RAND1	Random number used for sampling citizen adults in the screener	Public
RAND2	Random number used for random starts in the Pre-election questionnaire	Public
AddressStatus_Household	Address status (include postmaster return values) from households file	Public
State	State	Public
ZipCode	RESTRICTED. Zip code	Restricted
ScreenerType	Screener type - Online vs mail	Public
ScreenerStatus	Screener survey status	Public
ScreenerWasLaunched	Was screener launched?	Public
ScreenerStatusDT	Date/time ScreenerStatus was assigned	Public
ScreenerCheckAmount	Screener Check Amount	Public
PreElectionStatus	Pre-election survey status	Public
PreElectionWasLaunched	Was pre-election survey launched?	Public
PreElectionStatusDT	Date/time PreElectionStatus was assigned	Public
PreElectionCheckAmount	Pre-election check amount	Public
PostElectionStatus	Post-election survey status	Public
PostElectionWasLaunched	Was post-election survey launched?	Public
PostElectionStatusDT	Date/time PostElectionStatus was assigned	Public
PostElectionCheckAmount	Post-election check amount	Public
PreElectionCaseDisp	PreElection Case Disposition	Public
PostElectionCaseDisp	PostElection Case Disposition	Public
ANESOnlineScreenerFile	Online screener data indicator	Public
DataCollection_Status1_Screener	WEBSCRE: Status: Completed successfully	Public
DataCollection_EndQuestion_Screener	WEBSCRE: Question displayed when interview ended	Public
S1	WEBSCRE: We mailed our letter to [name]. Is that you?	Public
S1A	WEBSCRE: If wrong R, does correct R now live at this address or not	Public
S1B	WEBSCRE: If wrong R, can correct R take the survey now	Public
S1C	WEBSCRE: Reason correct R cannot take the survey now	Public

VARIABLE NAME	VARIABLE LABEL	VARIABLE STATUS
S2	WEBSCRE: If named invitation, does R live at this address	Public
S3	WEBSCRE: If family invitation, does R live at this address	Public
S4	WEBSCRE: If living at different address, how did R receive this letter	Public
S4a_Redacted	WEBSCRE: If living at different address, how did R get letter [open-ended] - Redacted	Public
S5	WEBSCRE: Number of adults 18 or older in household	Public
S5a	WEBSCRE: If large household, does R live in a household or in group quarters	Public
S5b1	WEBSCRE: Owner of place where R lives	Public
S5b2	WEBSCRE: Type of building where R lives	Public
S5b3	WEBSCRE: Number of people in building where R lives	Public
S5b4	WEBSCRE: Does R home have its own kitchen	Public
S5b5	WEBSCRE: Does R pay rent or have other arrangement	Public
S5d	WEBSCRE: If adults over 2, number of adults age 18 or older in household	Public
S6	WEBSCRE: Number of adults in household that are U.S. citizens	Public
S6a	WEBSCRE: If 1 adults in household, is the adult a U.S. citizen	Public
S6b	WEBSCRE: If R is only adult, is R a U.S. citizen	Public
S7	WEBSCRE: Gender of R	Public
S8	WEBSCRE: Is R 18 years or older	Public
S10_S_CAMPINTSTD	WEBSCRE: Interested in following campaigns standard	Public

6. LIST OF VARIABLES: FILE 4

VARIABLE NAME	VARIABLE LABEL	VARIABLE STATUS
FILE 4		
Version	Version of ANES 2016 Recruitment Pretest release	Public
HouseholdID	Household ID	Public
ANESVendorFile	Vendor data indicator	Public
ADDRESSMATCH	Did vendor address match sample address	Public
PersonID.1 - PersonID.239	PersonID.1 thru PersonID.239: PersonID - sequential numbering of records	Public
DROPPED.1 - DROPPED.239	DROPPED.1 thru DROPPED.239: Record dropped	Public
DROPDS.1 - DROPDS.239	DROPDS.1 thru DROPDS.239: Reason record dropped	Public
PRESELECTED_R.1 - PRESELECTED_R.239	PRESELECTED_R.1 thru PRESELECTED_R.239: Person preselected for conditions 1A and 2A (when possible)	Public
LONGPARTYNAME.1 - LONGPARTYNAME.239	LONGPARTYNAME.1 thru LONGPARTYNAME.239: RESTRICTED. Party name from Vendor	Restricted
LONGPARTYNAME_x.1 - LONGPARTYNAME_x.239	LONGPARTYNAME_x.1 thru LONGPARTYNAME_x.239: Party name from Vendor - categories	Public
VOTERSTATUS.1 - VOTERSTATUS.239	VOTERSTATUS.1 thru VOTERSTATUS.239: Voter status from Vendor	Public
E2012GVM.1 - E2012GVM.239	E2012GVM.1 thru E2012GVM.239: Voter turnout in 2012 General election from Vendor	Public
